This course seeks to impart knowledge of bioinformatics skills and applications, through practical cases, to carry out the analysis and interpretation of massive data generated through the new molecular technologies. Topics will include:

- Programming languages and databases management
- Next generation sequencing technologies
- Sequence analysis, assembly and functional annotation
- Bioinformatics applications, gene networks and systems biology

Participants
- Researchers involved in biological or agricultural sciences
- Graduate students involved in research that require bioinformatics analysis of omics data
- Preference will be given to participants from a national institution on the basis of the importance of the training to their daily work lives, with attention to geographical and gender balance
- Participants have to bring their own laptop

Funding
- Participants are expected to cover their own travel and living costs
- There is no registration fee for this course
- A limited number of grants to be used for accommodation, transport and meals for the duration of the course, will be available to a selected number of nationals of ICGEB Member states

Online application
Deadline
19 November 2018
